

SkyBook Airline Reservation System

Flight search, seat booking, PNR generation and ticket download.

Project Overview

SkyBook is an airline reservation platform for users who need to search flights, select seats, add passenger details and generate digital tickets, with an admin side for managing flight information.

The Problem

Managing flight reservations and seat availability manually is complex and error-prone, often creating duplicate reservations, unclear availability and slow ticket generation.

The Solution

A digital reservation workflow where users can search flights, reserve seats, enter passenger details, generate PNR numbers and download tickets digitally.

Key Features

- Flight Search — search flights by route and timing
- Seat Selection — select available seats visually
- Passenger Details — capture booking information
- Ticket Booking — complete the reservation flow
- PNR Generation — create unique booking references
- Admin Flight Management — manage flight records and availability

Technology Stack

Frontend: HTML, CSS, JavaScript | Backend: Spring Boot | Database: MySQL
